

ABSTRACT OF THE DISCLOSURE

A three-dimensional image/two-dimensional image display device includes a plurality of display pixels, and a lenticular lens for three-dimensional display. Each display
5 pixel is consisted of $M \times N$ number of sub-pixels to be viewed from N view points. A pitch \underline{a} of sub-pixels arranged in the longitudinal direction of ridge projection of the lenticular lens and a pitch \underline{b} of the sub-pixels arranged in a direction
10 orthogonal to the longitudinal direction of the lenticular lens satisfy the following expression. The $M \times N$ number of sub-pixels included in each of said display pixels are formed within a square area.

$$\underline{a} : \underline{b} = N : 1$$
